

KERNA

KERNA ROUTE ARCHITECTURE

High-Level Principles

Design goals:

- Role-aware navigation
- Progressive disclosure
- Zero dead ends
- Deep-link friendly
- Scales to 50+ clients

Routing style recommendation:

- 👉 `/app/...` for authenticated
- 👉 `/client/...` optional later (but not required now)

For now we keep unified.

MASTER NAVIGATION TREE

ROOT

```
/
├── /login
└── /app
```

AUTH LAYER

/login
/forgot-password (optional)
/reset-password (optional)

APP ROOT

/app

- /dashboard
- /leads
- /quotations
- /projects
- /vault
- /credentials
- /analytics (founder only)
- /settings

Role filtering happens in sidebar, not routing.

FOUNDER COMMAND CENTER

Route

/app/dashboard

Subviews (tabs or internal filters)

Do NOT create separate routes yet.

Inside dashboard:

- Overview
- Risk Alerts
- Revenue
- Activity

Future-proof but keep single route.

LEAD MANAGEMENT

/app/leads
/app/leads/import
/app/leads/:leadId

Purpose

- Board view
 - Lead detail
 - Lead editing
-

QUOTATIONS

/app/quotations
/app/quotations/new
/app/quotations/:quotationId
/app/quotations/:quotationId/revise

Notes

- Keep builder and detail separate
 - Revision is state, not new entity
-

PROJECTS (CORE SPINE)

This is your most important tree.

Project List

/app/projects

Views:

- table
- filters

- search

Project Detail (Dynamic)

/app/projects/:projectId

This is the **Project Dashboard**.

Project Sub-Routes

This is where most systems become spaghetti. We keep it clean.

/app/projects/:projectId

- /overview
- /modules
- /timeline
- /payments
- /vault
- /credentials
- /settings

Recommended Default Landing

When opening a project:

👉 redirect to [/overview](#)

MODULE WORKSPACE

Nested but clean.

/app/projects/:projectId/modules/:moduleId

Inside module page:

- version table
- upload panel

- approval status

Do NOT create separate routes per version yet.

CLIENT APPROVAL VIEW

Important decision.

Keep inside project scope:

`/app/projects/:projectId/review/:moduleId/:versionId`

Why this works:

- deep-linkable
 - secure
 - auditable
 - email-safe
-

PAYMENTS

Project-scoped.

`/app/projects/:projectId/payments`

`/app/projects/:projectId/payments/new`

RESOURCE VAULT

Global entry (founder/POC convenience):

`/app/vault`

Project-specific (primary):

`/app/projects/:projectId/vault`

CREDENTIAL VAULT

Same pattern.

Global:

/app/credentials

Project-level:

/app/projects/:projectId/credentials

ANALYTICS (FOUNDER ONLY)

/app/analytics

- /revenue
- /conversion
- /performance

Sidebar must hide from non-founders.

Route guard still required.

SETTINGS

Keep minimal for V1.

/app/settings

- /profile
- /team (future)
- /system (future)

CLIENT MODE ROUTING BEHAVIOR

Important dynamic logic.

When client logs in:

System checks:

project_count
client_view_mode

Routing Logic

If 1 project

Redirect:

/app/projects/:projectId

If multiple projects

Redirect:

/app/projects

UI Mode Handling

Mode does NOT change routes.

Mode changes **component visibility only**.

This is correct architecture.

ROUTE GUARD MATRIX

Founder

Access:

- everything
-

Management

Block edit routes but allow read.

Dev / Design / Content

Allow:

- assigned modules
- project overview (read)

Block:

- payments
 - credentials
 - analytics
-

Client

Allow:

- own projects
- approvals
- vault

Block everything else.

URL DESIGN RULES (Very Important)

Sneha must follow:

1. Use UUIDs, not incremental IDs
2. No business logic in URL
3. Keep nesting max 4 levels
4. Every entity must be deep-linkable
5. Approval links must be email-safe
