

KERNA

MASTER WORKFLOW — Client Project Lifecycle

We break it into **phases**, **roles**, **states**, and **automation logic**.

PHASE 1 — Lead Distribution

Trigger:

Sales lead generator gets 100 leads.

Role:

Sales Lead Manager

Action:

- Assign leads to sales members
- Track assignment count per person

Dashboard Logic:

Each lead has:

Lead ID

Assigned To

Status: New / Contacted / Interested / Rejected

PHASE 2 — Quotation Creation

Trigger:

Client shows interest.

Role:

Sales Rep → becomes POC

Action:

- Create quotation
- Send to client
- Generate client login credentials

System State:

Project Status: Quotation Sent

PHASE 3 — Client Login & Quotation Approval

Client Must:

- Fill profile
- Approve quotation via checkbox
- Agree to pricing

System:

Quotation cannot move forward without approval.

Status → Quotation Approved

PHASE 4 — Payment 1 (Advance)

Configurable:

POC enters:

Advance % (Default 60%)

Final % (Default 40%)

Current Method:

Manual payment entry:

Transaction ID

Amount

Date

Logic:

Work cannot start until advance payment is marked "Received".

Status → Advance Paid

PHASE 5 — Project Assignment

Trigger:

Advance paid.

Role:

POC assigns dev team.

Current Logic:

Manual assignment.

Future Scope:

Auto-assign based on:

- Current project load
- Capacity
- Skill match

(This becomes a Resource Management Module later.)

PHASE 6 — Kickoff Meeting

Participants:

Client + Dev + POC

Outcome:

- Scope defined
- Timeline defined

Dashboard Entry:

POC uploads:

Final Scope
Timeline
Milestones

Client Must:

Approve again.

Status → Scope Approved

👁️ PHASE 7 — Development Phase

Visibility Rules:

- Everyone can VIEW project progress.
- Only assigned department can EDIT.

Permission system required:

View: All internal users
Edit: Assigned department only

Notification System

When:

- Dev sends approval request → POC notified.
- Client rejects approval → POC + Dev notified.
- Payment pending → POC notified.

Notification types:

Approval Required
Approval Rejected
Payment Pending
Deliverable Ready

PHASE 8 — Deliverables Ready

Dev marks:

Ready for Client Approval

Client can:

- Preview
- Cannot download

If approved:

Status → Final Approval Given

If rejected:

- Notification sent
 - POC schedules meeting
-

PHASE 9 — Final Payment

Client must pay remaining %.

Until:

Final Payment Status = Paid

Deliverables locked.

Once paid:

Unlock Download

PHASE 10 — Release

Client can:

- Download deliverables
 - Access credentials
-

PHASE 11 — Hosting & Credentials

If hosting included:

- Store hosting credentials
- Allow client to download credentials

Credentials are:

- Viewable
 - Downloadable
 - Deletable upon request
-

PHASE 12 — Data Control

Client can request:

- Delete deliverables only
- Delete credentials only
- Delete entire project

If no request:

- Data retained per T&C
-

Dashboard Architecture Sneha Needs

Core Modules

1. Lead Management
 2. Quotation System
 3. Payment Tracking
 4. Project Management
 5. Approval System
 6. Notification Engine
 7. Permission System
 8. File Locker (with lock/unlock logic)
 9. Credential Vault
 10. Data Retention Controls
-

Core Project Status Flow

Lead Generated
→ Quotation Sent
→ Quotation Approved
→ Advance Paid
→ Team Assigned

- Scope Approved
- In Development
- Deliverable Sent
- Final Approved
- Final Payment Pending
- Completed

That's your clean lifecycle.

Important Design Decisions

Role Types

- Sales
 - POC
 - Dev
 - Design
 - Management
 - Client
-

Permission Layers

Role	View	Edit
Client	Own project	Approval only
Dev	Assigned projects	Dev fields only
POC	Full project	Everything
Others	View only	No edit

Critical Observations

You instinctively designed:

- Escrow-style release logic
- Multi-step approval gates
- Controlled file delivery
- Manual override payment system
- Controlled internal visibility

That's a serious operations backbone.

Future Scope (You Mentioned)

Auto Resource Allocation Module:

- Track active projects per dev
- Track capacity
- Suggest assignment
- Prevent overload

That's Phase 2 build.
